IMPACTS OF WILDFIRES: AFTERMATH AT INDIVIDUAL AND COMMUNITY LEVELS?

ABSTRACT

Wildfires are becoming a greater concern in many areas of the world. In this article, focus is on wildfires in two rural communities in Canada with emphasis on the aftermath at both the individual and community levels. Through openended interviews, information was generated about individual experiences with recovery and the creation of groups in the communities post-wildfire. The findings reveal that despite the differences in the severity of the fires, residents at both sites experienced impacts after the event. Disaster management implications include the need to focus on all community residents, not just those who experienced losses, while investing in the social rebuilding of communities.
